Abstract (en)

[origin: WO2007057604A1] The invention relates to a telescopic post (8) for a folding structure, which can be used to move the structure from a raised deployed position to a folded position and vice versa. The inventive post (8) includes a lower element (9) which can slide inside an upper element (10) which is solidly connected to the structure, the lower part (14) of said lower element (9) resting on the ground to form a base (11). The invention is characterised in that the upper element (10) is solidly connected to movement means, such as at least one caster (22), such that the caster (22) projects downward from the base (11) in the folded position but is withdrawn in the deployed position owing to the vertical movement of the upper element (10). The invention also relates to one such structure which is provided with the inventive post.
