Abstract (en)

[origin: WO2007038864A2] A device for dispensing a pre-measured amount of material from a container having a closed bottom, a mouth opening and a side wall comprises a discharge tube, connecting means for connecting an upper end of the discharge tube to the mouth opening of the container, a measuring reservoir attached to a lower end of the discharge tube for capturing a pre-determined amount of material, and pivot means pivotably connecting the reservoir to the discharge tube. The reservoir is pivotable from a first position in which the reservoir is substantially parallel to the discharge tube to a second position in which the discharge tube and the reservoir are substantially perpendicular to one another. With the reservoir in the first position, the reservoir and the discharge tube are insertable into a container having a relatively narrow mouth opening. With the reservoir in the second position, the discharge opening of the reservoir communicates with an opening in the second end of the discharge tube, in a dispensing ready position.
