Abstract (en)
[origin: WO2007042224A1] The invention concerns a method for changing groups of datagrams routed by packets of a transport stream received by a radio frequency receiver device, each of said groups of datagrams routing the useful data of at least one multimedia service and being identified by a unique identifier. The invention is characterized in that it includes following an external event, the following steps: obtaining the value of the time of occurrence of said external event/obtaining the identifier of one of said groups of datagrams at a time value immediately after said time of occurrence; enabling a radio frequency reception mode of said device; extracting packets from said transport stream comprising in their header said obtained identifier; disabling said reception mode; and extracting the useful data defining the or one of the services routed by said recovered packets so that said multimedia service is presented.
