Abstract (en)

[origin: WO2007048452A1] The invention is based on the concept of configuring the requirement for actuating a confirmation key such that it can be implemented separately for each video encoding station, and of assigning the requirement as necessary only to the encoders having relatively high error rates, since only they have an appreciable chance of eliminating encoding errors by repeated checking and actuation of the confirmation key. This involves determining, at defined time intervals, the error rate and the reading rate of the video encoding device and for each encoder the current individual error rate with and without actuation of the confirmation key, and storing them in the job distribution device.
