Abstract (en)

[origin: WO2007057109A1] The invention relates to a method for avoiding ribbon windings in the production of winding-on bobbins which are wound as a 'randomly wound package' type on the workstations of textile machines which manufacture crosswound bobbins, by changing the crosswinding, with which the thread is wound onto the winding-on bobbin, wherein the workstations have in each case a single-motor drive which can be actuated in a defined manner for rotating the crosswound bobbin and a single-motor drive which can be actuated in a defined manner for an oscillating thread guide. According to the invention, there is provision for the diameters (D_{SP})
