Abstract (en)

[origin: US2007088987A1] Systems and methods are disclosed for handling errors occurring when a first device requests information from a second device. Optionally the information and any corresponding error information are sent from the second device to a buffer. After the first device optionally receives the information and the error information from the buffer, the first device determines whether an error is associated with the information, and in response to determining that an error is associated with the information, the first device processes the error.
