Abstract (en)  
[origin: EP1953014A1] A shaft hole (18d) of a stabilizer bush (18) formed of an elastic body is fitted to a torsion portion (15) from an arm portion through a curved portion of a stabilizer (14). A gap (a) is formed between the shaft hole (18d) in the stabilizer bush (18) and an outer peripheral face of the torsion portion (15). Therefore, it is possible to reduce a friction force generated when the stabilizer bush (18) passes through the curved portion of the stabilizer (14), thereby facilitating the assembling. Also, it is possible to eliminate the need of forming an expanding slot in the stabilizer bush (18) in order to assemble the stabilizer bush (18) to the torsion portion (15), thereby preventing sand grains or muddy water from entering the expanding slot to cause noise or abrasion of the torsion portion (15). Thus, while the assembling of the stabilizer bush (18) to the stabilizer (14) is facilitated, abrasion on a face of the stabilizer (14) is prevented.
