Abstract (en)
[origin: WO2007057404A1] The invention relates to the production of highly reactive isobutylene homo- or copolymers with $M_n = 500$ to 45,000 by polymerizing isobutylene in liquid phase in the presence of a dissolved, dispersed or supported boron-containing catalyst complex by using, as a catalyst complex, a Bronsted compound (I) $[H^{+}]^{m+1} [R^1 R^2 R^3 R^4]^{n+1} L^x$ (I), in which: R^1 to R^6 represent aliphatic, heterocyclic or aromatic fluorine-containing hydrocarbon radicals, which are independent of one another and which each have 1 to 18 carbon atoms or silyl groups containing C_1 to C_{18} hydrocarbon radicals; A represents a bridge member that, via its nitrogen atoms forms bonds which are covalent to the boron atoms; L represents neutral solvent molecules; $n = 0$ or 1; $m = 0$ or 1, and; $x = 0$.
