Abstract (en)
[origin: WO2007063187A1] The invention relates to an anchoring means for securing a building element to a concrete-constructed building element, the anchoring means comprising a structure that is to be attached to an edge of the concrete-constructed building element (2) during manufacturing and that is provided with threaded/screw-in openings for securing members that receive loads from the building element, the structure provided with threaded openings comprising an elongated part (3), in which the threaded openings have been arranged and in which gripping means (5) extending inside the concrete-constructed building element (2) are arranged. The elongated part (3) is provided with at least one hole (6), on the inner surface of which there is at least one protrusion (7). The threaded openings are provided by means of sleeve-like parts (8), which are arranged to be secured to the elongated part (3) by inserting first ends of the sleeve-like parts (8) in the holes (6), whereby the protrusions (7) on the inner surfaces of the holes give in and deform and thus lock the sleeve-like parts (8) tightly in the holes (6).
