Abstract (en)

[origin: WO2007062443A1] The invention relates to a method and to a device (10) for determining the relevance of preparations (4) of sample arrays (1), containing a plurality of individual samples (3) on different positions. A device (11) for non-destructive sampling of preparations (4) of the sample array (1) is provided in order to produce a method and/or a device (10) which can be carried out in rapid manner and preferably, without destroying the preparations (4). Said sample array is connected to a data bank (12) and to a calculation unit (16) in order to process the sampled preparations (4) and in order to produce data fields of each individual sample (3) and in order to select at least one parameter from each individual sample data field and in order to compare said parameter or a value derived therefrom or a combination of parameters or values derived therefrom to at least one threshold value, said data bank containing information on the position of the individual sample (3) of the preparation (4). The invention also relates to a device (17) for displaying the value of the comparison to the at least one threshold value as relevant criterion for the individual sample (3), and to a memory (18) in order to store said relevant criterion.
