Abstract (en)

[origin: WO2007057467A1] The invention relates to a method of producing a contactless transponder comprising an antenna and an electronic module placed on a substrate and connected to the antenna by a conducting wire passing through the contact pads in the form of at least one stitch (5a, 5b, 6b). The method is characterized in that it comprises the following steps: production of a module as a single block, said module comprising at least one integrated circuit and contact pads; transfer of the module to the substrate before connection to the antenna. The invention also relates to the transponder obtained.
