Abstract (en)

[origin: WO2007062965A1] A mobile device (ME1, ME2) which is assigned to a person transmits an identification (ID1, ID2) to a central device (ZE) where localization of the mobile device (ME1, ME2) is initiated. After the mobile device (ME1, ME2) has been located in an area of an access system (Z1, Z2), the identification (ID1, ID2) is checked for authorization for access via the access system (Z1, Z2). Access via the access system is either allowed or denied on the basis of the result of the check. Access by an authorized person to secure areas (R) or devices (E) with the aid of a wireless device (ME1, ME2) which is usually carried along - for example a mobile radio terminal or a DECT terminal - thus becomes considerably easier and more convenient.
