Abstract (en)
[origin: WO2007059764A2] The invention relates to a security system consisting of at least two security modules that are connected to a network and transmit data via said network. At least one of said security modules can be switched into an energy-saving mode by a first local event, an idle command generated by the first local event, or an idle command transmitted by another security module and into an operating mode by a second local event, a wake-up command generated by the second local event, or a wake-up command transmitted by another security module.
