Abstract (en)
[origin: EP1956126A1] The machine has needles longitudinally movable in their needle beds, and blanks movably arranged between the needles. The blanks are actuated by a blank lock (1) that is arranged at a machine slide, where the lock has control paths (60, 61) for a control plate (6') arranged at the blanks. The plate is limited by two locking parts (2-5) and is switchable between the locking parts. Spacers (22, 42) are provided between the locking parts, where the two locking parts are spring-loaded by the spacers, and are abutted together in a mutual minimum distance that corresponds to height of the plate.
