Abstract (en)

[origin: EP1956170A2] The method involves triggering opening operation of a motorized opening frame (12) corresponding to tilting of the frame from a stop state to an opening state. Closing operation corresponding to the tilting from the stop state to a closing state is triggered. One of the operations is triggered by a predefined voluntary manual action (22) in a detection zone of an anti-pinch capacitive sensor (18). The sensor triggers an anti-pinch operation corresponding to the tilting of the frame from the closing state to one of the other states, when the sensor detects an obstacle (34) e.g. hand.
