Abstract (en)  
[origin: FR2893906A1] The device has a stand arm (8), which is rotatable, and a retractable lug (12) which is fixed indirectly to the stand arm. The lug is mounted slidingly on a lug support (13) connected to the arm such that it displaces in rotation around a stand axis. The device is designed to be mounted on a two-wheeled vehicle e.g. bicycle, such that the arm rotates between a high position (PH) and a low position (PB). The lug occupies an active position in which it blocks the path of a crankarm (9) and a retracted position in which it does not block the path of the crankarm.
