Abstract (en)
[origin: WO2007062620A1] The invention relates to a torsional vibration damper, in particular a divided flywheel, having at least two flywheel masses which can be rotated counter to the resistance of at least two deformable energy store elements, in particular helical pressure springs which are coupled to one another by at least one coupling device which, when a first energy store element deforms, is in particular relaxed, brings about selective driving of a second energy store element, and has at least a first and a second driver device. In order to prevent undesired shaking during operation of a motor vehicle which is equipped with the torsional vibration damper, the first driver device is coupled to a first coupling element, which is in turn coupled to the first energy store element, and the second driver device is coupled to a second coupling element which is in turn coupled to the second energy store element.
