Abstract (en)
[origin: WO2007062922A1] The invention relates to a refrigerating device (1), in particular a refrigerator and/or a freezer cabinet, comprising a heat-insulating housing (2) and a heat-insulating door (3). At least one component (4) is provided on or in the door (3), said component being fluidically and/or electrically connected by means of a line (5) to at least one element (6) which is arranged on the housing (2). The door (3) is articulated to the housing (2) by means of a multilink hinge (7). A support (13), which supports the line (5) when the door is open, is provided in the intermediate area between the door (13) and the housing (2). The invention is characterised in that the inner chamber of the refrigerating device (1) can be almost completely accessed, when a water dispensing unit (20) is provided on the door (3) and even with solid doors (3).
