Abstract (en)

[origin: WO2007066316A1] Method for sketching a face of a person, based on its recollection by an eyewitness, in which a set of two dimensional or spatial geometric forms are determined, such that each form or a combination thereof, corresponds to a specific part of a human face. Then a set of proportions between pre-selected geometric forms and a set of distances between pre-selected geometric forms are determined. The eyewitness selects a general, basic, facial outline that essentially matches the facial outline he remembers and then, a group of geometrical forms, selected by the eyewitness, is added to the outline, while, for each geometrical form, the eyewitness optimally matches the location, shape, size and orientation of the geometrical form to facial portions of the person, using the proportions, the distances and relative angles derived from the orientation of the geometric forms.
