Abstract (en)

[origin: EP1958549A1] The device has a supporting frame, by which an air purifying filter (5) is retained. The support frame forms guiding surfaces, such that air heated by burning candles is conducted by convection through the filter, where the candles are arranged on storage spaces (2) provided below the filter. The storage spaces are arranged on top of each other, and the guiding surfaces are formed, such that heated air is a part of air flow upwardly guided through the filter.
