Abstract (en)

In a machine for packaging articles into boxes, the articles feeding line (LC) is formed by two runs (78A, 78B) and extends beside the machine according to different possible configurations. The runs (78A, 78B) can be oriented on a horizontal plane, independently from each other, so as to allow different possible arrangements of the machine with respect to the production line. Likewise, the articles outlet line (LU, LA) can be arranged aligned with the longitudinal extension of the machine or perpendicular thereto. This allows the machine (M) to couple with working units arranged either aligned or perpendicular thereto.
