Abstract (en)

[origin: EP1958893A1] The reservoir (1) has a wall (3) with an internal surface on which a set of barrier components e.g. strings, is fixed. Each barrier component is extended between two locations of the internal surface. Two sets of barrier components (4) are placed along two directions in two planes, respectively, so that the fall of the solid bodies discharged in bulk in an upper part of the reservoir is slow down. The former set of barrier components is set in vibration using a vibration unit. The former set of barrier components is electrically conductive and is electrically connected to the ground.
