Abstract (en)

[origin: WO2007048913A2] The invention relates to a surgical implant used for stabilizing an opening site in a bone between two osseous corticals (20, 22) having a plate (14) with an upper concave part (16) and a lower concave part (18) in which the osseous cortical parts come to rest against one another. The concave parts are V-shaped grooves, each pressing against osseous corticals whereby canceling out the forces that tend to expel the plate to the front as well as the forces that tend to cause the plate to enter the osseous opening.
