Abstract (en)

[origin: US2007111796A1] Systems and methods for associating a device to a peripheral that is communicating to a game console or computing device. The peripheral is initially bound to a port of the game console or computing device. The device binds to the game console or computing device via an automatic or user-initiated sequence and then correlated to the port assigned to the peripheral. Data that is associated with the peripheral is communicated to the device after being correlated. The device and peripheral may also be associated based on a user profile. When the user signs-in to the game console or computing device, the device is associated to the peripheral via a peripheral identifier and configuration information in the profile.
