Abstract (en)

[origin: WO2007068582A1] The invention relates to an operator's device which communicates in a wireless manner with sensors and/or actuators. Positional data of the sensors/actors as well as the ways to get to the same are stored in the memory of the operator's device. Access data is evaluated and displayed in a program and processing unit of the operator's device in order to find a sensor or actuator required in a system when a signal is received.
