Abstract (en)

[origin: WO2007068385A1] The invention is aimed at improving the rate of detection of fraud attempts when a person enters a controlled space. It is based on the use of various sets of parameters arising from at least two different sensor systems, some of these sets of parameters being based on correlations of measurements arising from these different sensor systems. Learning is carried out in such a way as to characterize various types of fraud so as subsequently to allow identification of a fraud attempt by correlation between the measurements obtained and the characterizations of each type of fraud for each set of parameters.
