Abstract (en)

[origin: EP1961531A1] The device has a connection device to connect a nut and an operating key that includes an arm (17) made of magnetic material. The connection device is arranged such that the key is tilted with respect to the nut around a tilting axis for placing the key in rest position. The key rotatably drives the nut around a screwing axis (X-X) in a locking/unlocking direction, or freely rotates relative to the nut around the screwing axis over an angular clearance range of 170 degrees in a direction opposite to the locking direction after immobilization of the nut in end of locking operation.
