Abstract (en)  
[origin: EP1961879A1] Along the edge of a framework (2,11) there are turning elements (H) that have threaded cam surfaces (NF) and are each supported with positive locking in a direction of height adjustment against the framework and a drainage container. Turning the turning elements adjusts the height of the framework parallel to itself and relative to a drainage container (1,13) and fixes any position of adjustment from above against strain.
