Abstract (en)  
[origin: EP1962152A1] The mechanism has a jumper (27) changing between a maintaining position of a driven gear formed by three pinions, and a rotation release position of the gear. A safety device has a finger shaped locking unit e.g. spring plate, changing between a stable position in which the unit maintains the jumper in the maintaining position, and another stable position in which the unit releases the jumper in the release position. The unit passes from the former position to the latter position under an action of the gear, and vice versa under the effect of a return system.
