Abstract (en)  
[origin: WO2007073295A1] A system for releasably fixing accessories to a shelf (1), wherein the system includes a number of shelf accessories (5, 6) which each include a first engagement part (53), and a fixing device (2) which includes an elongate profiled element that has at least one second engagement part which is intended for co-acting engagement with the first engagement part of an arbitrary number of shelf accessories. The fixing device is intended to be fastened along the front edge of a shelf and includes a movable fixing element (20) which can be adjusted between a fixing position in which the first engagement parts that co-act with the second engagement part are fixed to the profiled element, and a release position in which the first engagement parts are released. With the purpose of achieving effective securement in the fixing position, the first engagement parts (53) or the second engagement part include or includes a resiliently deformable element (21) which is adapted to take a deformed state during abutment with the second engagement part or the first engagement parts in the fixing position, such as to increase the abutment surface between the co-acting engagement parts.
