Abstract (en)

[origin: WO2007071844A1] The invention relates to a device for transmitting physiological signals of a wearer comprising: a sensor capable of being positioned on the wearer so as to pick up physiological signals; wireless transmission means designed to transmit physiological data representative of the physiological signals through a wireless channel, characterized in that the sensor is identified by a unique identifier, and the transmission means comprise formatting means designed to format said physiological signals in a data format defined by frames having a payload, the formatting means moreover being designed to insert said unique identifier into said payload so as to form said physiological data.
