Abstract (en)
[origin: WO2007070970A1] A game maze for playing war games, combat games and the like is erected from a series of inflatable wall modules which can be deflated for transportation and storage. The wall modules are grouped together as desired to form passageways or cells within the maze. Some of the modules are formed with door openings through which game players can pass and window openings through which game players can view other parts of the maze and other participants.
