Abstract (en)
[origin: WO2007069999A1] A securement- or securing-related device (1) adapted for co-action with a load-supporting carrier belt, wherein the device includes a bobbin means (3), which is adapted for co-action with said carrier belt and which has the form of a bobbin unit that comprises two mutually parallel and mutually spaced cylindrical supportive surfaces (4a, 4b). The device includes means (11) for moving the bobbin unit (3a) from a first setting position to a second setting position, in which the bobbin unit is pivotally or rotatably mounted. A first remote control means (11) is adapted to cause the bobbin unit (3a) to move from said first setting position to said second position and vice versa. A second remote control means (12) is adapted to cause the bobbin unit to rotate or swing between end-wall connecting portions from a position, in which carrier belt sections can be moved readily in relation to the cylindrical supportive surface, to a position, in which the carrier belt section close to or adjacent to said bobbin can be wound around said cylindrical supportive surfaces, and vice versa.
