Abstract (en)
[origin: EP1801363A1] The plant has a condenser condensing a process medium, and a cooling unit provided for cooling the condensed process medium and component coolers. The component coolers are arranged such that the cooling unit cools the process medium to a predetermined temperature before entering into the component coolers. The component coolers successively heat the process medium, and are integrated into a condensate region (206) of a steam circuit (202). The temperature rise of the process medium is larger than a pre-induced temperature change.
