Abstract (en)

[origin: WO2007071681A1] A panel including display control circuits each (1 ') including a selection switch (T4) and a setting switch (T3) controlled by the same selection electrode Y_S, and a coupling capacitor for transiently coupling the control terminal of the circuit C to an addressing electrode X_D. The control method includes transmission periods and depolarisation periods in which all of the addressing signals have the same polarity. The invention enables, in particular, conventional and economical means to be used to control addressing electrodes X_D.
