Abstract (en)

[origin: FR2895561A1] The device (10) has a circuit (14) comprising an electric power supply source (16) and an electromagnetic relay (18) equipped with a coil (20) controlling the movement of a mobile contact (22) between a rest position (PR) and an active position (PA). A circuit (24) imposes a current flowing through the coil of sufficient intensity to move the mobile contact from its rest position towards its active position. A unit (30) reducing the intensity of the current flowing through the coil is activated when the mobile contact is in the active position.
