Abstract (en)

[origin: FR2895123A1] The method involves arranging reduced number of identical infrared sensors (1) centered on a given observation zone, where each sensor includes a specified number of cells. Beams of the cells are masked based on different combinations to provide information to a calculation unit (4) for localizing an individual in a position and during displacement, where the cells are triggered angularly. An independent claim is also included for a system for implementing an individual detecting method.
