Abstract (en)

[origin: EP1965367A1] A device for connecting plated-shaped elements along surfaces angularly oriented relative to each other, especially for connecting elements arranged orthogonally to each other and forming box-shaped bodies (20) with which identification luminous or non luminous signs are made, comprises a front shaped plate (10), made of translucent or opaque material, and a side band (12-12'), made of metal or other suitable material, shaped correspondingly to the outer profile, as well as to the inner one of any emptied parts, of said front plate (10) for globally and three-dimensionally depicting alphabetical letters, numbers, symbols and logotypes; the zone corresponding to the profile of one of the fronts of the side band (12-12') at least partly presents an irregular pattern or provided with through openings and is received in a continuous or discontinuous slot (14), obtained along or in the proximity of the edge (10') or (10'') of the plate (10), wherein it is stabilised by adhesives (22). Said adhesives also form a continuous or discontinuous kerb (24), along the inner surface of said side band (12-12'), adjacent the slot (14).
