Abstract (en)
The present invention refers to a modular blind which may be used both for windows and doors. The blind described in this invention comprises slats which may be connected by connection profiles which are rolled round a winding shaft. The blind is characterised in that it has been conceived on the basis of various types of elements for the purpose of providing several configuration possibilities, based on the distribution of said elements according to the user's requirements and wishes. Therefore, the blind comprises at least two of the following types of element joined by means of coupling profiles: slats which include safety means, slats which provide the possibility of letting in light, conventional blind slats and connection devices for dividing the blind into individual panels.
