Abstract (en)
The present invention provides a support for securing a ladder to an anchored pole, the support comprising: a. a body provided with pole receiving means; b. a ladder securing portion in engagement with the body and adapted to engage with a ladder; c. pole securing means mounted on the body, and moveable between an open configuration in which the pole is removable from the pole receiving means and a closed configuration in which the pole is retained within the pole receiving means; and d. control means linked to the pole securing means and operable to move the pole securing means between the open configuration and the closed configuration; wherein on application of a predetermined force to the control means the pole securing means is moveable from an open to a close configuration. Also provided is a ladder comprising such a support, a method of securing such a ladder in position relative to an anchored pole and a method of arresting the fall of a person climbing such a ladder. Also provided is a support for securing a ladder to an anchored pole, the support comprising: a. a body; b. a ladder securing portion in engagement with the body and adapted to engage with a ladder; c. pole securing means mounted on the body and moveable between an open configuration in which the pole is removable from the support and a closed configuration in which the pole is retained in engagement with the support; and d. control means coupled to the pole securing means and operable to move the pole securing means between the open configuration and the closed configuration; wherein on application of a first predetermined force to the control means the pole securing means is moveable from an open to a closed configuration.
