Abstract (en)

The equipment (1) has phase and neutral connecting levers (110, 130) and a biasing lever (120) i.e. ground connection lever, pivotingly mounted on a square parallelepiped insulating base (101) between raised and folded positions, where the levers are arranged with respect to one another and have identical length. The lever (120) is placed nearer to the lever (110) such that the lever (120) forms an obstacle in the raised position, to prevent folding of the lever (110) on the base. The height of the base is around 46.8 millimeters when one of the levers is in the raised position on the base.

Abstract (fr)

L'invention concerne un appareillage électrique (1) comprenant trois leviers de connexion (110,120,130) montés à pivotement sur un socle (101) entre une position relevée et une position rabattue sur le socle. Selon l'invention, un des trois leviers de connexion, appelé levier de détrompage, est placé à proximité d'un des deux autres leviers de connexion de sorte qu'en position relevée, il forme un obstacle qui empêche de rabattre cet autre levier de connexion sur le socle.
