Abstract (en)

[origin: US2007157940A1] The present invention is directed to a cigarette comprising a tobacco rod having a smokable filler material contained within a circumscribing outer wrapping material, and one or more inner wrapping strips positioned between the tobacco rod and the outer wrapping material and extending longitudinally along the tobacco rod. The inner wrapping strips comprise a binder in the form of an alkali metal salt and comprise a total alkali metal content of at least about 30,000 mug based on the total weight of the inner wrapping strips. The total alkali metal content can be derived from the alkali metal salt binder alone or a combination of the alkali metal salt binder and a second alkali metal additive. The inner wrapping strips can exhibit an ignition temperature of at least about 625° C. and may comprise 1 to about 8 strips, each strip having a width of about 2 to about 10 mm.
