Abstract (en)

[origin: FR2895690A1] A device for assembling components by folding the edges of panels together, comprises an arm (2) carrying a tool (1) exerting an effort on the edge of a panel to be folded over another panel. The arm is mounted to move axially with respect to a body (3, 4) of the device and under a force exerted by an elastic element (5). The elastic element is mounted between two mobile flanges (8, 9), each arranged to be displaced from a rest position. The arm is configured to move with one or other of the flanges along an axial direction to bring the two flanges closer together. An independent claim is also included for a method of crimping using this device.
