Abstract (en)

[origin: WO2007072525A1] The invention refers to a double map safety lock with a master key and a false key. It comprises at least one rebitting element (20) that on one hand interacts with the lock bolt plate and on the other with at least one of the lock's stop plates or gorges corresponding to at least one bit that differentiates the false key from the master key. The rebitting element (20) is moveable between an active position of stopping the stop plate (15') in a neutral position, where the false key can be used, and an inactive position where said stop plate (15') is released so as to disable the false key at the third closing turn of the lock bolt operated by the master key. The rebitting element may also have a means for resetting its active position.
