Abstract (en)
[origin: WO2007075135A1] The present invention relates to a bearing housing (1) comprising a first element (2) and a second element (3). The first and second element (2, 3) are connectable to each other, and adapted to abut each other in an interface (4) between the first and second element (2, 3). At least one cylindrical hole (5) is arranged in said interface (4) with its envelope surface (6) partly formed by the first element (2) and partly formed by the second element (3), wherein the hole (5) has at least one opening (7) on a first surface (8) formed by the first and second element (2, 3). The bearing housing (1) is further characterised in that at least one groove (11a) is formed in said first surface (8) of the first element (2) and at least one groove (11b) is formed in said first surface (8) of the second element (3), wherein said grooves 11a, 11b coincide to receive at least one rod-shaped fastening means for connection of the first and second element (2, 3).
