Abstract (en)

[origin: WO2007076560A1] An in particular frustoconical hollow body (1) which can be stabilized by positive air pressure and can be anchored on an underlying surface (30) via bracing means (14) is made up of a plurality of flexible material webs (4 to 12) each extending in the circumferential direction of the hollow body (1). The mass per unit area of the material webs (4 to 12) varies over the length of the hollow body (1).
