Abstract (en)

The present invention relates, on the one hand, to a method for limiting standstills in a weaving device of the Axminster type, in which, in at least one pile yam carrier, at least one pile yam of the same type is presented at a first and at least one second selectable position and that, following detection of the absence of this pile yam after selection at the first selectable position, the pile yam carrier furthermore presents this pile yam from the second selectable position. Preferably, detection of the absence of a pile yam is carried out at the position of the pile yam grippers or intermediate holders. On the other hand, the present invention relates to a weaving device provided to carry out such a method.
