Abstract (en)

[origin: EP1970480A1] The method involves receiving a liquid (7) which is to be heated in a container, and a heater (4) is switched on. An electrical power (POWER) is supplied with a value and the temperature (TH) of the heater or a heat conductor (9) is detected over a pre-determined time. The temperature rise value is determined and the two values are provided for the supply of the electric power. The value for the electric power for the heat conductor is selected in dependence of the determined temperature rise value, with which the operation of the heater is continued.
