Abstract (en)

[origin: EP1970501A2] The method involves casting and hardening a concrete element step-by step in two sections that are connected over a concrete reinforcement. An elongate stop end panel (10) is utilized for an edge-sided formwork plank of one of the section and weared after casting of the other section. The panel is partially bent or rolled around its longitudinal axis (15) and inserted between individual elements of the concrete reinforcement in a form that is bent or rolled around the longitudinal axis. The panel is unrolled and attached to the concrete reinforcement. Independent claims are also included for the following: (1) a stop end panel for manufacturing a reinforced, slab-like concrete element (2) an application of a stop end panel as a weared stop end panel between step-wise manufactured sections of a reinforced, slab-like concrete element.
