Abstract (en)  
[origin: WO2007080380A1] A gutter assembly (202) comprising an elongate gutter (204) for receiving water and defining a primary water transport channel (210) and a secondary water transport channel (212) is disclosed. The primary water transport channel (210) is connected to a drainage downpipe (238) and vortex reduction members (224) reduce formation of vortices in the vicinity of primary water inlets (216) of the primary water transport channel (210). When sufficient water flows into the gutter (204), the primary water transport channel (210) fills with water to become free of air to enable water to be transported along the channel (210) by means of suction in the drainage downpipe (238).
